

Electricity Service Provider

Given Problem Statement:

Aniruddha has a new company who wants to develop a software application which would make it easy for the electricity providers to get new customers and connect via a new single system PAN India. It would be easy for the customers as well, if they have multiple connections which they want from multiple vendors, then they will be able to buy it through a single system. This application would be used by the clients (i.e. Reliance Power, Tata Power, MSEB, etc.), their team, the customers and Aniruddha's team.

Roles in Aniruddha's Company:

1. Super-Amdin (Aniruddha - Owner).
2. Management Team.
3. Sales Team. (Point-Of-Contact: POC).
4. State-head.
5. District-head.
6. Town / City head.
7. Bill service team. (Billers).
8. Technician.
9. CRM (Customer Relationship Manager).

Roles Of Client Company:

1. Operations
2. BPO - Personnel, Manager - Level 1, Manager - Level 2.
3. Sales Team. (Point-Of -Contact).

Aniruddha's Company:

1. Management Team:

The management team are the people who hire, fire and manage the Sales person, state head, district head, town / city head, biller, technician. The role of the management team is limited to on-board and off-board the company employees.

2. Sales Team (Point - Of - Contact):

Once the sales team is onboarded in the company, they will go to multiple clients (i.e. Reliance, MSEB, etc.) once they get the business, they will be the POC of the company to the client. Now it's their responsibility to on-board the client on the application. If any of the companies have queries the client POC will contact the company POC. One POC can have / handle multiple clients at a time.

3. State Head:

The State-head is responsible to handle the whole state, district-head, town /city head. The state head can be the head of multiple states. The state-head decides which states the application provides the service to. The state head can also be the district head. The state head assigns the District head.

4. District Head:

The district head decides in which towns / cities to start the office / service in.

5. City / Town head

The City / Town head hires the local technicians and bill service people (Billers) and CRM . Each technician is assigned an area by the City / Town head. The Billers will be assigned a specific set of people from an area by the City / Town head.

6. Technician

Technician is responsible to repair any meter or electricity related issues if they occur and the issue is raised by the customer to the BPO. The technician is as assigned by the city / town head to an area.

7. Billers

The biller is responsible to go from place to place and upload a photo of the meter with the given company set of instructions. Then upon a successful upload the bill will be generated monthly.

8. Customer Relationship Manager

Whenever a new building is constructed or any customer wants to switch the electricity provider then they will approach the CRM. The CRM will have all the data of the companies who are registered with the Company. The CRM will show the different types of meters and the companies to the client. Upon selecting the meter type and the electricity service provider, CRM will on-board the customer on the company by filling up the mandatory customer data.

Clients Company:

1. Operations

The work of operations head would be, when the business deal is final with Aniruddha's company then Aniruddha's company's POC with the client company's POC and the operations team will be responsible to update their company details like, which types of meters do they have (House meter, industrial meter, solar meter, etc.), what is the rate per unit for each meter, what should be the time between each photo upload, etc. all the details required for the company to register on the application and to provide the electricity.

The other task of operations head is to create a state wise BPO and all the employees in the BPO (Employee, Manager - Level 1, Manager - Level 2). Each person is assigned to a certain city and certain district to handle.

2. BPO (Employee, Manager - Level 1, Manager - Level 2)

All the employees in the BPO will be assigned to a particular district, particular city by the operations team. So now whenever the customer raises a query the query will directly go to the BPO employee. Then the query will be assigned to a specific employee who is assigned to that particular district and city. Upon receiving the query the employee will assign the query to the local technician who is assigned to that specific area.

If the query is solved by the technician on the first go then the query will be marked as completed, if the customer is facing any issues with the technician not completing their work or something else then they can escalate the query to Manager - Level 1. If the manager Level - 1 is also not able to solve the query then the customer will raise the query to Manager - Level 2.

3. Sales Team. (Point-Of -Contact)

This person / team will be responsible to keep the communication between the two companies. From the deal finalization through on-boarding and any queries within the companies, this team will be responsible for handling all.

Notes:

1. When the client company fails to pay the bill of the current month and before the due date, then in that case all the services of the client company will be blocked. Services means, the client company will not be able to service any customer through the BPO, or use the software provided by Aniruddha's company.
2. Every client (Electricity provider) will be having the same database schema, so whenever the new client is on-boarded the application should be able to generate new database schema for each company. (Multi-Tenant Application).
